# Classification of Courses

## Course Numbering System

### Lower-division courses

Lower-division courses, numbered from 100 to 299, are designed primarily for freshmen and sophomores. Certain classes are closed to freshmen who lack the designated prerequisites or whose majors are outside the units offering the courses. This information is available in the course catalog [1] or from the student's academic advisor.

### Upper-division courses

Upper-division courses, numbered from 300 to 499, are designed primarily for juniors and seniors. Prerequisites and other restrictions should be noted before registration. Courses at the 400 level apply to graduate degree requirements for some graduate programs when approved by the Graduate College.

### Graduate-level courses

Graduate-level courses, numbered from 500 to 799, are designed primarily for graduate students. However, an upper-division undergraduate student may enroll in courses numbered 500-599 with the approval of the student's advisor, course instructor, department chair and dean of the college in which a course is offered. If such a course does not meet an undergraduate graduation requirement, it may be eligible for use in a future graduate program on the same basis as work taken by a nondegree graduate student. Undergraduate students should review additional information about graduate credits earned by undergraduate students [2].

### Omnibus courses

Omnibus numbers are used for courses offered on an experimental or tutorial basis or for courses in which the content is new or periodically changes. Each academic unit uses that unit's prefixes with omnibus course numbers. The general nature of the work required for a particular omnibus course is consistent from unit to unit, but subject matter varies. Omnibus courses often are offered for a variable number of credit hours.

Within the academic catalog and course catalog, abbreviations are frequently used with a colon to introduce specific omnibus course topics, which are shown in the omnibus course abbreviations chart below (e.g., MGT 494 ST: Cultural Factors in International Business).

### **Visiting student program**

The numbers 597, 697 and 797 in the LAW prefix have been reserved for the visiting student program in the Sandra Day O'Connor College of Law.

### **Global education programs**

Courses with the prefix SAO are reserved for participants in programs offered through the Global Education Office [3]. Courses with an SAO subject are used in two ways: either to provide general university elective credit for specific programs or courses or as a placeholder course for participation in partnership and exchange programs.

In the case of a placeholder course, the course remains on the student's academic record until the student's record is updated by the Global Education Office following completion of the student's study abroad program. The SAO-subject course is then dropped from the student's record and replaced with the ASU courses, credits and grades equivalent to the coursework completed abroad. Students must register for at least the

number of credit hours equivalent to full-time study at ASU (i.e., 12 credit hours for undergraduate students and nine credit hours for graduate students during the fall and spring semesters, or one to six credit hours during the summer session). Students participating in a GEO partnership program must register for the subtopic “SAO: Study Abroad Program,” whereas participants in an GEO exchange program must register for the subtopic “SAO: Exchange Program.” The SAO placeholder course is not an indication of the level of coursework or the total number of credit hours the student may complete abroad.

Courses completed as part of these programs that do not have direct ASU course equivalencies are awarded “Department Elective” credit, using a respective subject with a course number of 1DE, 2DE, 3DE or 4DE. Lower-division courses at the 100-level are given 1DE, and 200-level are given 2DE. Upper-division courses at the 300-level are given 3DE, and 400-level are given 4DE.

## Course Component Descriptions

Each course is composed of one or more components, different instructional modes or meeting types such as labs, studios, lectures and seminars. A course can have more than one component. However, all components must be scheduled. The primary component is always the graded component.

Course Component	Description
<b>Individualized Instruction</b> (IND)	This is a class in which an individual student is provided an opportunity for original study or investigation in a major or field of specialization on a more autonomous basis. Normally a contract or plan is used, and the student is supervised by faculty or practitioners.

Course Component	Description
<b>Integrated Lecture/Lab</b> (LEL)	<p>The integrated lecture/lab is a class that has some lecture and some hands-on components but does not require a separate time like a traditional lab. It is scheduled like a lecture. This is primarily used in educational technology, computer science, technology, and engineering. As per ABOR: "At least fifteen (15) contact hours of recitation, lecture, discussion, testing or evaluation, seminar, or colloquium, as well as a minimum of thirty (30) hours of student homework is required for each unit of credit."</p>
<b>Laboratory</b> (LAB)	<p>The hands-on, workshop component of a class is usually held in a laboratory. The laboratory time is separate from the lecture although it is often associated to a lecture. This is primarily used in science and engineering. As per ABOR: "Laboratory courses require a minimum of forty-five (45) contact hours per unit of credit."</p>
<b>Lecture</b> (LEC)	<p>A lecture is the traditional method of instruction in which students are taught a subject by a member of the faculty. As per ABOR: "At least fifteen (15) contact hours of recitation, lecture, discussion, testing or evaluation, seminar, or colloquium, as well as a minimum of thirty (30) hours of student homework is required for each unit of credit."</p>
<b>Practicum</b> (PRA)	<p>A practicum is structured practical experience in a professional program, supervised by a practitioner and/or faculty member with whom the student works closely. Internships and student teaching fit into this category. These classes are often held off campus at a professional location. The practicum component should also be used for internships and field studies courses. As per ABOR: "Each unit of internship or practicum must require a minimum of forty-five (45) contact hours per unit of credit."</p>
<b>ProMod</b> (PRO)	<p>In ProMod courses the role of lectures is deemphasized in favor of learning based on projects. The learning is driven by the needs of the project, not by predetermined lecture topics. Students will go where the questions take them, leading to an individualized exploration of the issues at hand.</p>

<b>Course Component</b>	<b>Description</b>
<b>Recitation</b> (REC)	A recitation is a small interactional meeting that combines formal presentation, review and interaction between the students and an instructor, and it is usually combined with a lecture as the primary component. Recitations are often lead by teaching assistants (TAs) or graduate assistants (GAs) to supplement a lecture. TAs/GAs will review the lecture, expand on the concepts and usually allow for question-and-answer time. The recitation component should also be used for courses previously categorized as discussion (also known as break-outs). As per ABOR: "At least fifteen (15) contact hours of recitation, lecture, discussion, testing or evaluation, seminar, or colloquium, as well as a minimum of thirty (30) hours of student homework is required for each unit of credit."
<b>Research</b> (RSC)	Under the supervision of a faculty member or group of faculty, the student conducts research that is expected to lead to a specific project such as dissertation, thesis, report or publication. Assignments might include data collection, experimental work, data analysis or preparation of a manuscript. This component is appropriate to use for continuing registration, dissertation, thesis, individualized instruction, research, etc.
<b>Seminar</b> (SEM)	A seminar is a small class that emphasizes discussion, presentations by students, and written research papers. As per ABOR: "At least fifteen (15) contact hours of recitation, lecture, discussion, testing or evaluation, seminar, or colloquium, as well as a minimum of thirty (30) hours of student homework is required for each unit of credit."
<b>Studio</b> (STO)	The studio is a hands-on workshop component of design and the arts courses. As per ABOR: "Studios must involve at least thirty (30) contact hours and at least fifteen (15) hours of homework for each unit of credit."

**ABOR Policy # 2-224 regarding Academic Credit can be found at:**

<https://public.powerdms.com/ABOR/documents/1491660>

**ABOR Definition of a Unit of Credit:** An hour of work is the equivalent of 50 minutes of class time (often called a "contact hour") or 60 minutes of independent study work. A minimum of 45 hours of work by each student is required for each unit of credit. Ordinarily, a course must cover a one-week period for every unit of credit given.

During summer sessions, however, six units of credit may be given over a five-week period.

As a result of this violence and oppression, they have developed models of recovering healthy nations while challenging violations of their human rights in the domestic and international arenas. This history has given rise to a widespread cultural revitalization movement often referred to as decolonization. Scholars from an array of academic disciplines are producing a growing body of literature about decolonization. How does an urban address impact the federal trust relationship with nonreservation Indians? What are the social, political, and economic implications for a family who lives off the reservation and away from tribal homeland? Course explores these issues and dynamics and challenges the student to examine the unique identity and contributions of urban Indians. Students learn the history of Indigenous migrations to the city and assess current needs and concerns through consultation work coordinated with Phoenix area Indian Centers and nonprofit organizations. AMS	469	Abject Bodies and the Politics of Trash	Examines the possibilities inherent in "theorizing from the gutter"; looking at the world not from a lofty "Ivory Tower" but from the slime, the muck, the dumpster, the trash heap, the wasteland, the discarded and the downtrodden. Takes its theoretical framework from a radical 1960s manifesto called SCUM Manifesto by Valerie Solanas and from the French feminist philosophies of Julia Kristeva, who theorized the abject as a relationship with the grotesque that reveals the deep-seated fear of death. Uses these theoretical positions to examine trash, both abstractly and literally. Works through a variety of concepts ranging from actual trash, garbage, waste, toxic sludge, pollution and dirt, and tackles more abstract notions of trash such as the knowledge produced on the fringe in circuses, amusement parks, "trailer trash" zones, freak shows and the bodies of those marked as "Other" or different. ARS	121	Introduction to Global Heritage Studies	Heritage is something that can be passed from one generation to the next, something that can be conserved or inherited, and something that has historic or cultural value. For instance, there are 1121 physical sites across the globe that the United Nations has designated as World Heritage, ranging from the Grand Canyon National Park to Stonehenge and the Alhambra, from Auschwitz Birkenau and Machu Pichu to the Great Barrier Reef. Heritage can be a physical site like these places, but it can also be intangible, as in language, culture, popular song, food, literature or dress. Focuses on key concepts, definitions, theories and debates central to understanding what heritage is, and on heritage studies as a field of inquiry. Through readings and discussions, explores a broad range of topics, including the history and philosophy of museums; intangible versus tangible heritage; cultural patrimony and repatriation; the social, economic and political contexts that shape museums; the influence of the digital age on these institutions; and the main functions of museums and historic sites--collection and care of objects, exhibits, interpretation, education and governance.	N	LEC	N	GNA	Herberger Institute for Design and the Arts	School of Art	3		Credit is allowed for only ARS 221 or ARS 494 (Museum Histories, Theories, And Debates)
ARS	222	Museums as Sites of Extraction	Introduces concepts and theories around museums and possible problematic and extractive collection practices. Looks at histories of collections, where and how collections come into being and how to find new ways forward for broadening collections. By problematizing museum collections, analyzes and suggests more ethical and equitable practices for the field. Also looks at labor and funding models, hiring practices and interaction(s) with the communities specific museums reside within.	N	LEC	N	GNA	Herberger Institute for Design and the Arts	School of Art	3		
ARS	223	Introduction to Museums and Social Justice	A recent spate of scandals and protests have forced some of the world's greatest museums and heritage institutions to face up to some difficult ethical issues. These include reassessments of their board-vetting procedures to avoid reputational controversies, a more thorough review of corporate sponsors vis-a-vis a museum's mission, the development of action plans to address the legacy of colonial theft and Nazi looting. Nonprofit organizations and heritage institutions are also reassessing staffing demographics, salary differentials, and discussing ways to address racial and gender diversity in acquisition policies, permanent collection displays and exhibition schedules. Examines past and current controversies and investigates the ways in which these unprecedented events are fundamentally changing the definition of what constitutes arts and heritage institutions in the twenty-first century. ARS	323	Curatorial Activism	Current art world statistics demonstrate that the fight for gender and race equality in the art world is far from over: only 14% of the work displayed at MoMA in 2016 was by non-white artists; only a third of artists represented by U.S. galleries are female, but over two-thirds of students enrolled in art and art-history programs are young women. However, there are many curators working worldwide to offset these racial and gender disparities. Arranged in thematic sections focusing on feminism, race and sexuality, this course examines and illustrates pioneering examples of exhibitions that have broken down boundaries and demonstrated that new approaches to curating are possible, from Linda Nochlin's "Women Artists" at LACMA in the mid-1970s to the Whitney Biennial of 2019. This course profiles key exhibitions by pioneering curators, including Okwui Enwezor, Nan Goldin, Marcia Tucker, Catherine de Zegher, Fred Wilson, Jonathan Katz, and other curators who understand that institutions must be a driving force in this area and a vital source of inspiration for today's expanding new generation of curators.	N	LEC	N	Z1	Herberger Institute for Design and the Arts	School of Art	3		Prerequisite(s): ARS 120 or 121 with C or better; Credit is allowed for only ARS 323 or ARS 494 (Curatorial Activism) OR Visiting University Student

N	LEC	N	GNA	Herberger Institute for Design and the Arts	School of Art	3	HU	Prerequisite(s): one 100-level course in APH, ARS, ASB, ENG, FMS, HST, MHL, MUS or SLC with B- or better; Credit is allowed for only ARS 330 or ARS 394 (Genre: Portraits) OR Visiting University Student
ARS	331	18th- and 19th-Century European Jewelry Design	The 18th century was defined by stylish sociability that included beautiful dress, sumptuous interiors and exquisite, fashionable jewelry. Who were the influencers for jewelry design during this period? How was society defined by these ornaments? What were the rules of engagement? Did these opulent ornaments affect social strategies? How did jewelry materials evolve into more modern and recognizable forms? All of these questions are answered in this course. The cultural history of jewelry design mirrors the historical and collective customs of society from the established aristocracy, to the rising middle classes, to the expansion of cultural awareness among every world citizen when travel became widely available. So much so, that upon the turn of the 19th century, jewelry design shifted from appearing as solely a status of power and wealth to an eloquent symbol of worldly knowledge and cultural awareness.	N	LEC	N	GNA	Herberger Institute for Design and the Arts	School of Art	3		Prerequisite(s): minimum 45 hours; Credit is allowed for only ARS 331 or FSH 331 or ARS 394 (18th & 19th Century European Jewelry Design) OR Visiting University Student
ARS	335	Fashion and Dress in Visual Culture	Explores fashion and dress from the Renaissance to the modern period and considers dress as commenting on society, gender, race and current events. ARS	555	Museums and Social Justice	A recent spate of scandals, protests and a global pandemic have forced museums and heritage institutions to face up to some difficult ethical and financial issues. In the wake of the Black Lives Matter protests, these include reassessments of staffing demographics, salary differentials, and discussions of how best to address racial and gender diversity in acquisition policies, permanent collection displays and exhibition schedules. The #MeToo movement has resulted in difficult conversations about sexual harassment and gender discrimination in museums as well. Other recent public controversies have demanded reevaluations of board vetting procedures to avoid reputational controversies, a more thorough review of corporate sponsors vis-a-vis a museum's mission, and the development of action plans to address the legacy of colonial theft and Nazi looting. Covid-19 has also greatly affected museums--attendance, annual budgets--and has resulted in mass layoffs and organizational restructurings, as museums are left to wonder about their financial viability moving forward. Also discusses whether museums have a moral responsibility to respond to and become engaged with compelling social justice issues like race, immigration, health care, climate change--or whether they should remain neutral. Indeed, the question of museums and social justice has plagued the museum world's preeminent professional organization, the International Council of Museums (ICOM), which, since 2017, has been attempting to redefine the museum as a site for public discourse on urgent topics; amidst debate and turmoil, a possible redefinition of museums of the 21st century as sites for social justice. Students create performances and context-specific projects by making connections between art, life and public space. Since performance art/live art cannot be separated from the body who makes it, this course continually investigates the meaning and significance of performance art. For instance, what distinguishes an action as art? Is it different from an every day action like brushing your teeth? What makes it different? When is a job or labor a performance? How does a person (artist or audience) know when the art begins or when it ends? All performances are documented and presented in video or still photography examples online. Select works are posted on the Live Art Platform website at the end of the semester. ASB	363	From Cells to Society: Understanding Complexity	Equips students with concepts and empirical examples they need to understand the role of complexity in the world around them. Complexity science is based on the fundamental principle that entities and phenomena in the world around us are systems composed of many parts that interact to produce their global characteristics. For example, cells interact to produce organs and tissues, which in turn interact to produce physiological processes (i.e., the capacity to metabolize food to produce new compounds and energy) and physical infrastructure (skeletal and muscular structure) which produce organisms. Organisms, (e.g., humans) interact to form groups, villages, cities, nations. ASB	442	Global Cities	This close look at megacities in the global south decisively challenges the outdated impression that the rest of the world's cities still lag way behind the U.S. and Europe. The social sciences' debate over "global cities" anchors our examination of the reorganization of metropolitan social space under impact of neoliberal globalization since the 1970s. Explores urban inequalities of slums and dreamworlds; compares vernacular and transnational styles of urbanism (in architecture, design, markets, consumerism, jobs, ads, ways of living); and asks how transnational flows of people, capital and culture have reconfigured ethnic relations and national identities rooted in global cities. Students become virtual transnational flâneurs, tacking between the slums and skyscrapers of global cities, and conduct guided research on a global megacity to investigate how the production of the global city changes the lived space and urban culture of local residents, and how they respond. BIO	112	Discovery: Why Sex?	"Why?" is a question that animates the youngest of children to the most seasoned of scientists. The acts of asking and answering "Why?" highlight the integrated nature of scientific knowledge and discovery. Demonstrates scientific disciplines are not walled cities in which knowledge is neatly segregated from lines of inquiry and knowledge in other disciplines. Instead, scientific concepts weave throughout and between disciplines and scientists increasingly rely on colleagues from different scientific fields to find answers to scientific questions. So our journey to find responses to the question "Why Sex?" takes us not just to biology, but also to earth science and to physics. Along the way, scientists are linked together not only through concepts that crosscut the disciplines, but also in their reliance upon key scientific skills such as the ability to observe, think critically, measure, gather data and communicate their findings. Presents a foundation from a historical perspective, then the basics of an organism's stress response, including the activation of the sympathetic nervous system and the hypothalamic-pituitary-adrenal axis. The stress response is highly conserved and allows organisms to respond and adapt to their environment. A highly effective and robust stress response facilitates adaptation and behavioral flexibility. However, a maladaptive stress response can produce detrimental outcomes. The ultimate goal is to understand the dynamic and reciprocal processes by which the stress response and brain interact to produce behavioral flexibility and resilience or detrimental outcomes.	N	LEC	N	OPT	College of Liberal Arts and Sciences	School of Life Sciences	3		Prerequisite(s) degree- or nondegree-seeking graduate student; Credit is allowed for either BIO 568 or PSY 568
BIO	570	Fundamentals of CAS Science	Many phenomena of critical relevance to human society are dynamic systems that change over individual and evolutionary time scales, and are highly interactive, both within and between systems. That is, they are complex adaptive systems (CAS), and thus share isomorphic properties like near-decomposability, hierarchical organization, scale-free networks, self-organized criticality, and emergence. Fundamentals of CAS science explores the diverse, interdisciplinary applications of a complex adaptive systems across the social, behavioral, and life sciences. Environmental issues are no longer local and solutions cannot remain provincial. Scientists must become envoys of knowledge that is global; science is now part of an unavoidable and contentious public discussion on these issues, and we need it to catalyze solutions. Increasingly, scientists who are communicators are moving into positions of leadership, engaging with society and changing their academic institutions from within. This seminar provides leadership training and important skills for early career scientists to communicate science. CAS	363	From Cells to Society: Understanding Complexity	Equips students with concepts and empirical examples they need to understand the role of complexity in the world around them. Complexity science is based on the fundamental principle that entities and phenomena in the world around us are systems composed of many parts that interact to produce their global characteristics. For example, cells interact to produce organs and tissues, which in turn interact to produce physiological processes (i.e., the capacity to metabolize food to produce new compounds and energy) and physical infrastructure (skeletal and muscular structure) which produce organisms. Organisms, (e.g., humans) interact to form groups, villages, cities, nations. CAS	501	Fundamentals of Complex Systems Science: Evolution	The enormous diversity of biological, social and technological systems is the product of evolution. As Darwin put it poetically: "There is grandeur in this view of life, with its several powers, having been originally breathed by the Creator into a few forms or into one; and that, whilst this planet has gone cycling on according to the fixed law of gravity, from so simple a beginning endless forms most beautiful and most wonderful have been and are being evolved." In short, complexity is the product of evolutionary processes. This, in turn, implies that understanding complexity requires us to understand its evolutionary origins. This course is a comprehensive introduction to the evolutionary history of complex systems and the principles and mechanisms that guide this dynamic. Covers the consequences of evolutionary history of complex systems, such as vulnerability to failure or limits of the potential of these systems to change and adapt. CAS	502	Fundamentals of Complex Systems Science: Computation	Most systems are complex. Complex systems share a number of critical features across all domains, including the fact that all complex systems process information and perform computations in the broadest sense. Explores the informational and computational dimensions of complex systems with an emphasis on how complex systems acquire, process, store and transmit information in a systematic way across the social, behavioral and life sciences and engineering.	N	LEC	N	GNA	College of Global Futures	School of Complex Adaptive Systems	3		Prerequisite(s): degree- or nondegree-seeking graduate student
CAS	503	Fundamentals of Complex Systems Science: Collectives	From neurons in a brain to fish in a school to people in an economy, collectives are all around us. These are complex systems in which we understand in some detail how the individual components behave and interact, but the behavior we are interested in is at the larger scale of the aggregate. The behavior of systems like these is challenging to predict and understand largely due to the sheer number of interacting components, as well as the unintuitive way that contributions from individuals scale up to have large collective effects. Complex systems science has developed an array of conceptual tools to help understand collective behavior. Explores these foundational concepts, including emergence, scaling laws, dynamical modes and coarse-graining. Uses these tools to de-mystify powerful aggregate-scale effects, from impressive feats of swarm intelligence to potentially harmful instabilities and hysteresis.	N	LEC	N	GNA	College of Global Futures	School of Complex Adaptive Systems	3		Prerequisite(s): degree- or nondegree-seeking graduate student
CAS	520	Agent-Based Modeling	Agent-based modeling is a method to study the macro-level consequences of micro-level interactions of agents representing individuals, households, firms or other type of actors. Agent-based modeling is used to study the dynamics of complex adaptive systems across different domain areas. Covers the basics of agent-based modeling including programming computer simulations and how this method is used to study complex adaptive systems in different application areas. Examines the method for scientific research, especially the various ways of doing model analysis. Students perform individual assignments.	N	LEC	N	GNA	College of Global Futures	School of Complex Adaptive Systems	3		Prerequisite(s): degree- or nondegree-seeking graduate student
CAS	521	Methods for Complex Systems Science: Network Analysis	Network science within the framework of complex adaptive systems. Begins with general introductions to different kinds of networks and their basic network properties. Then progresses to the mathematics and algorithms of network analysis while learning about computational feasibility and the importance of random graph comparisons. Each week students are responsible for readings and a write-up of that week's topics. These write-ups help build toward the final assignment incorporating all topics covered in this class. Upon completion, students should feel confident incorporating networks and their associated complexity into their research and worldview.	N	LEC	N	GNA	College of Global Futures	School of Complex Adaptive Systems	3		Prerequisite(s): degree- or nondegree-seeking graduate student
CAS	522	Methods for Complex Systems Science: Dynamical Systems	Focuses on the mechanisms through which complexity emerges in evolving and dynamical network architectures. Some of the best-known examples include gene expression networks, adaptive ecological networks, and neural networks for cognitive information processing. Complex systems theory deals with dynamical systems with a large number of interacting variables. Therefore, after an introduction to graph and network theory, the course covers the basic concepts of dynamical systems theory: continuous and discrete systems, attractor dynamics, bifurcation, and chaos. After introducing information theory, devoted to the fundamentals, the second part focuses on applications, especially to network dynamics. Students acquire familiarity through the analysis of concrete examples of both deterministic and random dynamics in the form of Boolean networks and random walks. CAS	523	Methods for Complex Systems Science: Statistics and Dimensionality Reduction	Because complex systems involve a large number of interacting components, observational studies of these systems typically generate data sets of high dimension. Examples include the hundreds or thousands of distinct neurons in a brain, genes in a cell, people in a society, firms in an economy, or texts in a corpus. To make sense of such data, a diverse set of data analytic tools has been developed to summarize key properties at the population level (statistics) and characterize predictable lower-dimensional patterns (dimensionality reduction). Provides a guided tour of such tools most relevant to complex adaptive systems. With a solid foundation in inferential statistics, students encounter PCA-type linear projections, nonlinear manifold techniques, topic modeling, clustering methods, network statistics, as well as more abstract foundations for how these methods work and when they fail. Students hone their data skills by applying state-of-the-art open-source software to real-world datasets.	N	LEC	N	GNA	College of Global Futures	School of Complex Adaptive Systems	3		Prerequisite(s): degree- or nondegree-seeking graduate student
CAS	540	Socioecological Complex Systems	We live in a world that is neither wholly human nor wholly natural. Human decisions and actions combine with biological processes and physical forces transform cities, rural landscapes, ecosystems and biogeography, river systems, coastlines and the atmosphere. By emphasizing the importance of networks and feedbacks, complexity science is especially helpful in providing insight into the complex interactions between the human and natural components of the socioecological systems that are so critical to our lives and wellbeing. Examines key concepts for understanding socioecological system dynamics from a complex systems perspective. Explores how methods drawn from complexity science can trace the complex web of feedbacks between social, biological and geophysical processes and help to better understand and plan for change and stability in socioecological systems. Also looks at how complexity science can help contribute to relevant policy and governance for SES.	N	LEC	N	GNA	College of Global Futures	School of Complex Adaptive Systems	3		Prerequisite(s): degree- or nondegree-seeking graduate student
CAS	541	Complex Urban Systems	Despite occupying only a tiny fraction of the world's area, cities house over half of earth's human population, consume over two thirds of global energy, and emit over 70% of global CO2 emissions. It is estimated that the combined ecological footprint of earth's urban areas already exceeds the entire area of our planet, and still globally 3 million more people migrate to cities every week. Cities are also the global engines of innovation, wealth creation, and production efficiencies. Thus, cities are both drivers of unsustainable behavior and our best hope for innovating sustainable solutions. Examines key concepts for understanding the complexity of urban systems, and explores how methods drawn from complexity science can be applied to urban structures and dynamics to better understand both past and future outcomes. Shows how complexity science might contribute to relevant policy and governance of cities and whether such a contribution is advisable.	N	LEC	N	GNA	College of Global Futures	School of Complex Adaptive Systems	2-3		Prerequisite(s): degree- or nondegree-seeking graduate student
CAS	542	Sustainability as a Problem Complexity	Sustainability challenges are complex challenges. Sustainability as a problem of complexity explores in a systematic way the interconnected nature of sustainability challenges and presents a complex systems science-based framework for developing sustainability solutions.	N	LEC	N	GNA	College of Global Futures	School of Complex Adaptive Systems	3		Prerequisite(s): degree- or nondegree-seeking graduate student
CAS	543	Complexity Economics	Complexity economics is the study of economic systems as evolving, complex systems. These systems consist of interacting individuals who perceive their environments, and take actions based on multiple criteria, which in turn affect their environments and the decisions available to other individuals. Complexity economics is not an extension of conventional, neo-classical economic theory and practice, which is based on the concepts of equilibrium, optimization and aggregation. Complexity economic attempts to understand economic phenomena through concepts of evolution, emergence, path dependency and the interdependent relationships between heterogenous individuals whose actions shape their environments. This offers a new basis for theory and practice that better reflects not only real problems and scenarios, but also how individuals make decisions and how those decisions have consequences for both the environment and society. CAS	544	Innovation in Complex System	Innovation is a central property of complex systems. Without innovation there would be no evolution of complex systems. Explores the dynamics of innovation in complex systems across a number of different domains, including biological, social, cultural and technological innovations. Focuses on the common principles and differences guiding innovation dynamics. Also focuses on unintended consequences of innovation, such as cascading effects and innovation traps and investigates why certain systems fail to innovate. Identifies common features of innovation across complex systems. CAS	545	Disease as a Complex System	Disease and failure are properties of complex systems. All organisms, groups, societies, technologies, ecosystems and the planetary system are complex systems. Disease can be seen as a failure in complex system function and has, at its root cause, the breakdown of complex regulatory structures that maintain function and facilitate adaptation. Comprehensive introduction into the origins, mechanisms and consequences of disease in a number of complex systems ranging from organisms to the planet and the technosphere. Explores disease, failure and health of these systems and investigates the underlying complex systems properties that are responsible for these different states. Identifies common features of failure across complex systems. CAS	546	Bio-Inspired AI and Optimization	Provides a survey of a variety of algorithms for optimization and multiagent control that are inspired by natural systems. Algorithms inspired by biological or physical systems can often be viewed as idealized models of those antecedent systems. Consequently, also explores potential problems (and solutions) in these algorithms that are analogous to fundamental but less well-known issues in the biological and physical systems that inspire them.	N	LEC	N	GNA	College of Global Futures	School of Complex Adaptive Systems	3		Prerequisite(s): degree- or nondegree-seeking graduate student
CAS	570	Fundamentals of CAS Science	Many phenomena of critical relevance to human society are dynamic systems that change over individual and evolutionary time scales, and are highly interactive, both within and between systems. That is, they are complex adaptive systems (CAS), and thus share isomorphic properties like near-decomposability, hierarchical organization, scale-free networks, self-organized criticality, and emergence. Students read thinkers ranging from Aristotle, Plutarch and Cicero to Viktor Frankl, Toni Morrison and Marge Piercy--and brings to bear their own life experiences--to understand concepts of love, friendship, work, community, citizenship and identity in relation to living an examined life. Expands these studies through practical experiences of service work, meditation and film to create a vital cohort and intellectual community. A central assessment for the course, the Organic Reflective Assessment (ORA), is a series of prompts and responses designed to allow students to think about and receive feedback from professors regarding the practice and methods of liberal learning: how to read texts and annotate them, how to ask questions of authors, how to think about one's own life in relation to and using language from classic texts--on the idea that to use existing, perhaps even widely known, language and relate it to our lives is a way to make our ideas known to ourselves and others. Students have need to keep up with these responses during the retreat. CEL	391	Shakespeare's Leadership Lessons: Performance and Politics in the Pines	Allows students to read, perform and debate Shakespeare's relevant lessons for 21st-century leadership through three classic plays, two unique pedagogies and one unique setting. Students read Shakespeare's bildungsroman of leadership and statesmanship, <i>The Life of Henry V</i> , and participate in a pre-departure seminar providing a context to read, perform and discuss <i>The Tragedy of Macbeth</i> and <i>The Tempest</i> . Explores the theory and practice of leadership and statesmanship: ambition, moral character, education for legitimate and just leadership, how to inspire toward noble aims, situational ethics and cultural context. Involves formal sessions of reading and discussion, along with independent scholarship, hikes, and conversation. Coaches students in a leadership lab, focusing on <i>Henry V</i> , by nationally acclaimed speakers that share their deep knowledge and lessons from their careers in Washington and around the globe, plus a costumed performance. Finally, with <i>Henry</i> , <i>Prospero</i> , and <i>Macbeth</i> as profiles in leadership, students write a series of final essays examining the texts carefully, then applying Shakespeare to personal "character" as an emerging leader. It is also the most widely misinterpreted. In China, Daoists, Buddhists and Confucians have each taken its short, pithy statements as warrant for their very different belief systems. In the West, missionaries, new-age pundits, hippies, rock-stars, mystics and LSD advocates each claim to understand the "true meaning" of Laozi's mystical words. But "the farther one travels, the less one knows..." Students read representative samples of these explanations to understand why this brief book of wisdom has endured for over 2000 years. CTE	110	Introduction to Culture, Technology and Environment	Investigates the dominant critical perspectives about three of the most fundamental constituents of human civilization: culture, environment and technology. The attention to the interaction and interdependence between environment and technologies (old and new) has been recently rising. Brings in culture--from the biological to the mammal--as another node to the approach, helping students realize the co-existence of these aspects in our life, to see how these topics interact, and the profound influence they have on contemporary issues. After introducing various notions of culture, environment and technology, draws on concrete, hands-on and interactive case studies that epitomize how culture, environment and technology have been connected throughout human history and, indeed, have shaped the modern, technologized and globalized world in which humans and their nonhuman planet mates live today. DSC	555	Strategic Design Futures	Designers are increasingly addressing more strategic and long-term situations, while non-designers are increasingly interested in using design approaches to address diverse challenges. Strategic design is a practice that focuses on formulating strategies (problem setting) rather than only implementing strategies (problem solving). Students understand and practice a variety of strategic design methods and mindsets with the aim of changing and envisioning futures. With hands-on activities and real-world context, students use and develop core strategic design skills such as visualization, sensemaking, synthesis, speculation and facilitation. Some design tools that may be used include storyboards, user flows, journey mapping, participatory ideation, visioning, service blueprints, prototyping-testing.
